## UHER VG 830 stereo VOR-VERSTÄRKER

### Funktionsbeschreibung Stummschaltung

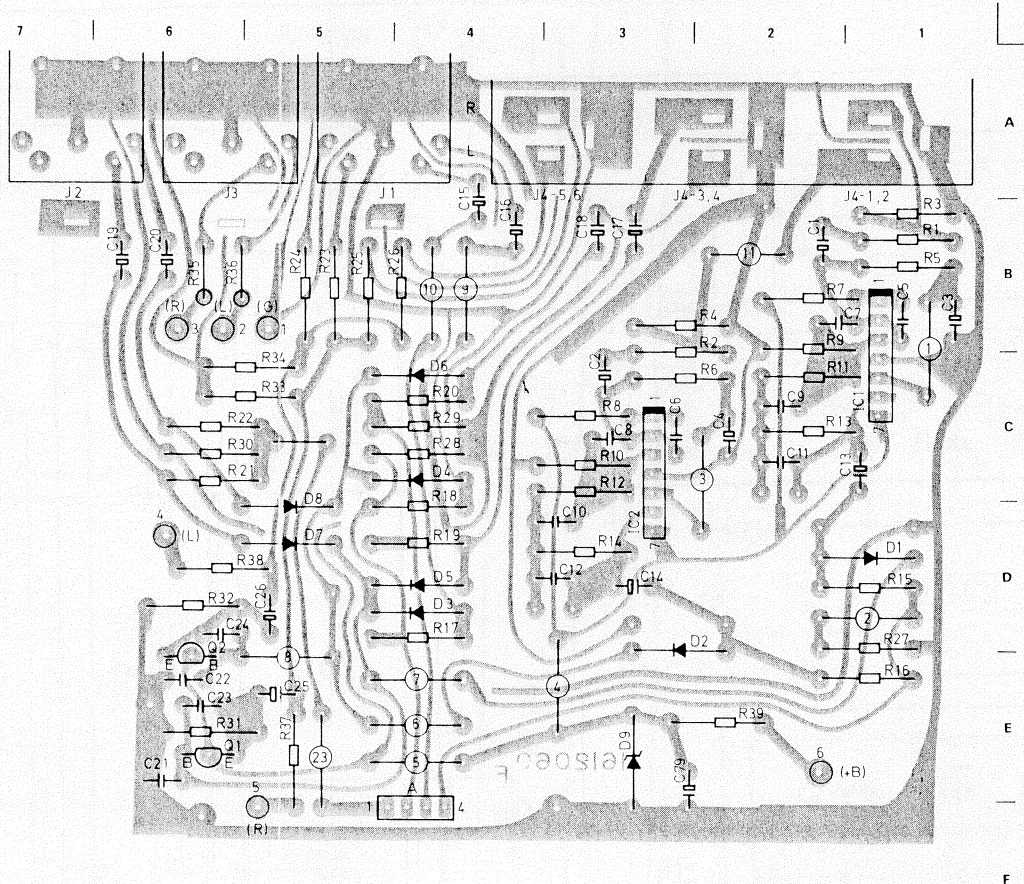

Zur Unterdrückung von Störgeräuschen bei Ein- und Ausschaltvorgängen ist der Stereo-Vorverstärker VG 830 mit einer speziellen Stummschaltung ausgestattet. Diese arbeitet wie folgt:

Nach Drücken der EIN-Taste wird C 64 über R 108 aufgeladen. Etwa 2 Sekunden lang wird Q 12 durchgesteuert. In dieser Zeit wird mit Q 13 und Q 14 der Eingang, sowie mit Q 17 und Q 18 der Ausgang des Ausgangsverstärkers stummgeschaltet. Einschaltgeräusche werden somit unterdrückt.

Bei jedem Schaltvorgang des PROGRAMM-Wählers wird - über die Kontakte H 1-H 2 - der Kondensator C 64 über R 109 entladen und die Stummschaltung aktiviert. Umschaltgeräusche werden unterdrückt.

Beim Abschalten des Gerätes - oder auch Ausfall der Netzspannung - wird an der Basis von Q 11 positives Potential wirksam, da sich C 73 (47  $\mu$ F) langsamer entlädt als C 77 (3,3  $\mu$ F). Über Q 11 wird die Stummschaltung mit Q 12 auch beim Abschalten des Gerätes aktiviert. Ausschaltgeräusche werden ebenfalls unterdrückt.

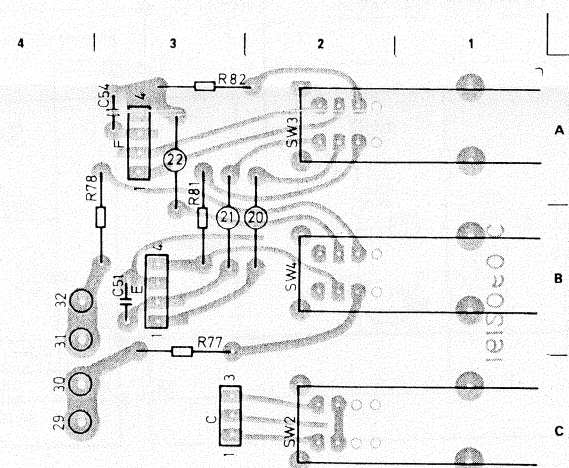

Zudem wird beim Ausschalten über Q 11 und R 109 der Kondensator C 64 entladen. Auch bei sofortigem, erneutem Einschalten des VG 830 ist die Stummschaltung wirksam.
